

Amendments To The Claims

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

Claim 1. (currently amended) A two-way satellite communication system including a terminal having a receiver unit and a transmitter unit, the terminal being configured to transmit and receive signals to and from a hub via a satellite, the system comprising:

a terminal interface directly between the transmitter unit and the receiver unit in the terminal configured to permit exchange of data between the receiver unit and the transmitter unit, wherein the receiver unit ~~is configured to~~ translates data received from a host to a data frame that conforms to a predetermined protocol format ~~that is supported by the hub~~ so that data is provided to the transmitting unit via the terminal interface ready for transmission;

a burst channel demodulator interface coupled to an antenna associated with the terminal and configured to permit exchange of the data frame between the terminal and the satellite, the data frame conforming with different return channel frame formats;

a satellite-to-hub interface configured to permit receipt of the data frame at the hub from the satellite, the hub being configured to modify the data frame for transmission to an external packet switched network;

a hub-to-terminal interface configured to support the exchange of data from the hub to the terminal using a multi-layer protocol; and

a host interface directly connecting the terminal to the host and configured to support transmission of data bursts from the terminal to the host, the data bursts conforming with a Universal Serial Bus (USB) standard of the host.

Claim 2. (canceled)

Claim 3. (canceled)

Claim 4. (original) The system according to claim 1, wherein the multi-layer protocol supports a digital video broadcast (DVB) stream.

Claim 5. (original) The system according to claim 1, wherein the data that is exchanged by the terminal interface conforms with an Internet Protocol (IP) protocol.

Claim 6. (original) The system according to claim 1, wherein the return channel format exhibits at least one of a little endian orientation and a big endian orientation.

Claim 7. (original) The system according to claim 1, wherein the hub transmits inroute group definition (IGD) packets to the terminal, each of the IGD packets specifying return channels and traffic loading information.

Claim 8. (original) The system according to claim 1, wherein the packet switched network is an Internet Protocol (IP) network.

Claim 9. (currently amended) A method for supporting two-way communication over a satellite system that includes a terminal having a receiver unit and a transmitter unit, the terminal being configured to transmit and receive signals to and from a hub via a satellite, the method comprising:

interfacing directly the receiver unit with the transmitter unit within the terminal to permit exchange of data, wherein the receiver unit ~~is configured to~~ translates data received from a host to a data frame that conforms to a predetermined protocol format ~~that is supported by the hub~~ so that data is provided to the transmitter unit from the receiver unit ready for transmission;

interfacing the terminal with the satellite to permit exchange of the data frame, the data frame conforming with different return channel frame formats;

interfacing the satellite with the hub to transmit the data frame to the hub from the satellite, the hub being configured to modify the data frame for transmission to an external packet switched network;

interfacing the hub to the terminal to support the exchange of data from the hub to the terminal using a multi-layer protocol; and

interfacing the terminal directly with the host to support transmission of data bursts from the terminal to the host, the data bursts conforming with a Universal Serial Bus (USB) standard of the host.

Claim 10. (canceled)

Claim 11. (canceled)

Claim 12. (original) The method according to claim 9, wherein the multi-layer protocol in the step of interfacing the hub to the terminal supports a digital video broadcast (DVB) stream.

Claim 13. (original) The method according to claim 9, wherein the data in the step of interfacing the receiver unit with the transmitter unit conforms with an Internet Protocol (IP) protocol.

Claim 14. (original) The method according to claim 9, wherein the return channel format in the step of interfacing the terminal with the satellite exhibits at least one of a little endian orientation and a big endian orientation.

Claim 15. (original) The method according to claim 9, further comprising:
transmitting inroute group definition (IGD) packets by the hub to the terminal, each of the IGD packets specifying return channels and traffic loading information.

Claim 16. (original) The method according to claim 9, wherein the packet switched network in the step of interfacing the satellite with the hub is an Internet Protocol (IP) network.

Claim 17. (currently amended) A two-way satellite communication system including a terminal having a receiver unit and a transmitter unit, the terminal being configured to transmit and receive signals to and from a hub via a satellite, comprising:

means for interfacing directly the receiver unit with the transmitter unit in the terminal to permit exchange of data, wherein the receiver unit is configured to translate data received from a host to a data frame that conforms to a predetermined protocol format ~~that is~~ supported by the hub so that data is provided to the transmitter unit from the receiver unit ready for transmission;

means for interfacing the terminal with the satellite to permit exchange of the data frame, the data frame conforming with different return channel frame formats;

means for interfacing the satellite with the hub to transmit the data frame to the hub from the satellite, the hub being configured to modify the data frame for transmission to an external packet switched network;

means for interfacing the hub to the terminal to support the exchange of data from the hub to the terminal using a multi-layer protocol; and

means for interfacing directly the terminal with the host to support transmission of data bursts from the terminal to the host, the data bursts conforming with a Universal Serial Bus (USB) standard of the host.

Claim 18. (canceled)

Claim 19. (canceled)

Claim 20. (original) The system according to claim 17, wherein the multi-layer protocol supports a digital video broadcast (DVB) stream.

Claim 21. (original) The system according to claim 17, wherein the data conforms with an Internet Protocol (IP) protocol.

Claim 22. (original) The system according to claim 17, wherein the return channel format exhibits at least one of a little endian orientation and a big endian orientation.

Claim 23. (original) The system according to claim 17, further comprising:

means for transmitting inroute group definition (IGD) packets by the hub to the terminal, each of the IGD packets specifying return channels and traffic loading information.

Claim 24. (original) The system according to claim 17, wherein the packet switched network is an Internet Protocol (IP) network.

Claim 25. (currently amended) A computer-readable medium carrying one or more sequences of one or more instructions for supporting two-way communication over a satellite system that includes a terminal having a receiver unit and a transmitter unit, the terminal being configured to transmit and receive signals to and from a hub via a satellite, the one or more sequences of one or more instructions including instructions which, when executed by one or more processors, cause the one or more processors to perform the steps of:

interfacing directly the receiver unit with the transmitter unit in the terminal to permit exchange of data, wherein the receiver unit is configured to translate data received from a host to a data frame that conforms to a predetermined protocol format ~~that is supported by the hub~~ so that data is provided to the transmitting unit from the receiver unit ready for transmission;

interfacing the terminal with the satellite to permit exchange of the data frame, the data frame conforming with different return channel frame formats;

interfacing the satellite with the hub to transmit the data frame to the hub from the satellite, the hub being configured to modify the data frame for transmission to an external packet switched network;

interfacing the hub to the terminal to support the exchange of data from the hub to the terminal using a multi-layer protocol; and

interfacing the terminal directly with the host to support transmission of data bursts from the terminal to the host, the data bursts conforming with a Universal Serial Bus (USB) standard of the host.

Claim 26. (canceled)

Claim 27. (canceled)

Claim 28. (original) The computer readable-medium according to claim 25, wherein the multi-layer protocol in the step of interfacing the hub to the terminal supports a digital video broadcast (DVB) stream.

Claim 29. (original) The computer readable-medium according to claim 25, wherein the data in the step of interfacing the receiver unit with the transmitter unit conforms with an Internet Protocol (IP) protocol.

Claim 30. (original) The computer readable-medium according to claim 25, wherein the return channel format in the step of interfacing the terminal with the satellite exhibits at least one of a little endian orientation and a big endian orientation.

Claim 31. (original) The computer readable-medium according to claim 25, wherein the one or more processors further perform the step of:

transmitting inroute group definition (IGD) packets by the hub to the terminal, each of the IGD packets specifying return channels and traffic loading information.

Claim 32. (original) The computer readable-medium according to claim 25, wherein the packet switched network in the step of interfacing the satellite with the hub is an Internet Protocol (IP) network.

Claim 33. (previously presented) The system according to claim 1, wherein the host interface uses USB super frames to send the data bursts to the host.

Claim 34. (previously presented) The method according to claim 9, wherein interfacing directly the terminal with the host includes the use of USB super frames to send the data bursts to the host.

Claim 35. (previously presented) The system according to claim 17, wherein the means of interfacing directly the terminal with the host includes the use of USB super frames to send the data bursts to the host.

Claim 36. (previously presented) The computer readable-medium according to claim 25, wherein interfacing the terminal directly with the host includes the use of USB super frames to send the data bursts to the host.
